

VINSS

**Agree privately.
Complete the deal together.**

One room for conversation, agreed terms
and escrow settlement on Canton.

**The agreement is in chat.
The payment is somewhere else.**

THE BUYER

**Wants to inspect the work
before releasing payment.**

THE SELLER

**Wants payment assurance
before releasing the work.**

Both reconstruct scope, funding and approval from messages and screenshots.

Illustrative direct deal. Customer costs and frequency still need measurement.

Start with a small digital deal between two wallet users.

Initial customer hypothesis

WHO

Independent buyers and sellers in builder communities.

WHEN

A new counterparty. A written scope. A clear acceptance decision.

WHY FIRST

They can decide quickly and finish a pilot task within days.

Bring the counterparty. Keep the deal in one room.

Invite link or QR • Marketplace Jobs is a second entry point

01 Discuss & agree

Private conversation becomes an accepted offer.

02 Fund escrow

The payer authorizes the payment allocation.

03 Deliver & review

Submit the work; approve or request revision.

04 Settle

Execute the transfer and retain a ledger receipt.

Current scope: two-party escrow. Group chat is separate; no dispute/refund choice yet.

Private context. A shared, authorized outcome.

Content privacy

OpenMLS encrypts conversation and detailed offer content.

Deal authority

Canton and Daml control record visibility and who can act.

Payment execution

Allocation transfer and the settlement receipt share a transaction.

Why now: wallet + token-allocation integration has a recorded DevNet proof.
Authorized viewers can still see deal metadata, including amounts and Parties.

A private workflow for deals people already arrange directly.

Approach	What it gives the user	Decision to make
Chat + wallet	Flexible negotiation and payment tools	Keep agreement and payment aligned manually.
Marketplace / middleman	A platform or person coordinates the deal	Accept that service's process and trust model.
VINSS	Private context + shared agreement + escrow state	Bring both people onto Canton; accept current MVP limits.

Differentiation hypothesis: preserve the direct relationship while adding a shared completion process.

Charge for escrow. Keep core deal actions free.

STANDARD ESCROW

0.5%

Minimum USD 0.10 per deal.
Proposed payer-paid fee.

INDIVIDUAL VIP

\$3 / month

2× qualifying points
20% off escrow → 0.4%
Same USD 0.10 minimum.

Planned, not billed. Core chat and deal actions: no separate VINSS fee. Network costs remain separate.

A working foundation. Customer validation comes next.

1 CC

Real DevNet settlement

Receipt and receiver holding
recorded on 6 Oct.

69

Passing local tests

24 test files in the supplied 7
Oct developer log.

3

Group members tested

Real OpenMLS; simulated
wallet and ledger.

These prove defined technical scenarios—not adoption. Fresh live browser recording remains outstanding.

Recruit pairs, then test whether the second deal happens.

Founder-led acquisition hypothesis

Reach	10 qualified invitations through builder communities; aim for 3 interviews.
Activate	5 buyer-seller pairs try the invite and deal flow; observe every blocker.
Retain	Look for 2 pairs requesting another deal within 30 days, without rewards.

Prospective channels: HackCanton community, DevWeb3Jogja, Blockchain Pioneer Student Club.
Outreach candidates only; no confirmed partnership or customer claim.

**Measure completed deals,
not message counts.**

NORTH STAR

**Genuine buyer-seller deals
settled per week.**

Next evidence: 10 interviews • 5 pilot pairs • 2 repeat requests

Targets, not results. No documented customer interviews or measured adoption supplied.
Exclude team tests, simulated transactions and reward farming.

Prove Canton first. Expand to multiple chains later.

01 / Validate Canton

Interview users, observe five pairs and resolve onboarding failures.

02 / Test repeat use

Measure completion, support cost and willingness to pay before billing.

03 / Expand later

Marketplace publishing, VIP/points and demand-led multichain integrations.

No multichain release date committed. No active cross-chain settlement. A possible airdrop is deferred.

Help us validate the next five private deals.

THE ASK

Pilot introductions, wallet/validator access and settlement/recovery review.

Built from the VINSS private-deal concept; now implemented on Canton.
