

VINSS

Private chat.
Agreed work.
Escrow settlement.

A private deal workspace for clients and freelancers on Canton.

The gap between chat and payment

A direct client deal often loses its shared context.

The freelancer needs to know

Which scope did the client accept?
Is the payment funded?
What remains before settlement?

The client needs to know

What did the offer include?
Does the delivery match?
What does approval authorize?

Initial use case: one client and one freelancer completing a defined digital task.

One room for the deal

An invite link or QR brings both people into the same workflow.

01 Discuss and agree

Private messages lead to an accepted offer.

02 Fund escrow

The client authorizes the payment allocation.

03 Deliver and review

The freelancer submits work. The client approves or requests revision.

04 Settle payment

After approval, the freelancer settles and receives a ledger receipt.

Encrypted group chat supports team discussion. Escrow currently uses two-person rooms.

Escrow has explicit payment states

Acceptance, funding and settlement each require their own action.

State	Who acts	What the state means
Accepted	Offer accepter	Both people have an agreement.
Funded	Client / reviewer	VINSS has validated the referenced token allocation.
Approved	Client / reviewer	The submitted work has approval for the VINSS settlement path.
Settled	Freelancer / fulfiller	The token transfer completed and a receipt records the outcome.

VINSS references the allocation. The current module has no dispute or refund choice.

Why Canton

Private negotiation connects to an authorized business record.

Content privacy

OpenMLS encrypts chat and detailed offer terms in the browser.

Members decrypt and keep plaintext history locally.

Deal authority

Canton controls contract visibility. Daml assigns each deal action to a Party.

Token Standard Allocations provide the payment mechanism.

Authorized ledger viewers can see deal metadata, including amounts and Parties.

Recorded technical progress

A real DevNet settlement and a separate local messaging suite.

Evidence	Recorded result	Scope
6 Oct 2026 escrow	1 CC transferred; receipt and receiver holding IDs retained	Real Canton DevNet run
7 Oct 2026 test suite	69 tests passed across 24 files	Local automated tests
Messaging integration	10 test messages; Alice-Bob and three-member group	Real OpenMLS WASM; simulated ledger / wallet

The updated browser-wallet messaging flow still needs a fresh live recording.

The first users already have a client

Direct invitations make the product useful before marketplace scale.

Initial cohort

3-5 client-freelancer pairs.

One defined digital deliverable, a named reviewer and compatible Canton wallets.

What the pilot must show

Both people can join and complete the funded workflow.

They understand approval and choose to return for a second task.

Proposed audience and pilot. Customer demand and retention are not yet measured.

A subscription for recurring work

Optional VIP is the proposed commercial model.

Benefits to validate

Reusable offer templates.
Deal activity exports.
More marketplace listings.

The buyer is a freelancer or small team managing repeat projects.

How to test it

Observe second deals and interview repeat users.

Identify the benefit they would pay for before setting a price or building billing.

VIP billing and Points issuance are pending. Private chat and escrow are core features.

A pilot with measurable decisions

Recruit pairs, observe the first deal, then test repeat use.

Proposed measure	Target for a small pilot	Decision
Invite and deal completion	At least 80% of controlled attempts	Fix recurring failures before expanding.
Repeat use	At least 2 pairs start a second task within 14 days	Check whether the product solves a recurring need.
VIP interest	At least 2 repeat-user interviews identify willingness to pay	Choose a benefit for a pricing test.

Targets are proposed, not achieved results. Report raw counts for the 3-5-pair cohort.

The next Canton milestone

Complete the live wallet demonstration and the first observed pilot.

Record current-release chat and group delivery.

Verify the funded deal through its settlement receipt.

Use participant feedback to resolve the biggest blockers.
