

Acquire a pair through one private invite

VINSS can begin with direct client work. A freelancer brings an existing client into a useful workflow without waiting for marketplace liquidity.

Positioning

A private deal workspace for clients and freelancers on Canton. The message is concrete: discuss the work, agree on the offer, review delivery and settle payment in one room. Encrypted chat is the conversation layer. Escrow connects that conversation to a payment decision.

Stage	Action	Evidence to collect
Recruit	Invite 3-5 pairs through freelancer communities and Canton builder contacts.	Source of each pair and the task they want to complete.
Activate	Assist with the first controlled test-token deal and observe both wallets.	Invite success, funding failures and steps requiring help.
Retain	Ask each successful pair to complete a second small task.	Repeat starts, completed payments and reasons for returning.
Refer	Ask returning users to invite their next counterparty.	New pairs arriving through a completed engagement.

The first case study

With participant consent, document the original workflow, the task they completed in VINSS, where they needed help and whether they returned. Include the actual deal outcome. This gives the next prospect a concrete reason to try the product.

Proposed sequence

Week 1: current-release wallet verification and recruitment. Week 2: first observed deals. Week 3: repeat tasks and interviews. Week 4: fix recurring blockers and decide the next cohort. This is a pilot proposal, not a delivery commitment.

Optional VIP for recurring client work

The proposed business model is a subscription for people managing repeated projects. Core private chat and escrow remain the product foundation.

Proposed paid benefit	Recurring problem it could solve	Validation before billing
Reusable offer templates	Rewriting the same scope and delivery conditions.	Watch repeat users create their second offer.
Deal activity exports	Preparing client records and reviewing past engagements.	Ask users to show the export they actually need.
More marketplace listings	Managing several available services or projects.	Validate listing demand once publishing exists.

Commercial decisions still to make

Validate the paid benefit before setting a price and implementing billing. Track paid members, repeat deals and support time. Subscription revenue would equal paid memberships multiplied by price; no revenue forecast is supported yet.

Costs and the expansion decision

Measure hosting, ledger transaction costs, support effort and the cost of recruiting an activated pair. Network charges and a future VINSS subscription are separate costs. Broader payment use also needs a dispute/refund design and reliability work. Expand the cohort when users complete and repeat the flow with a manageable support burden.

Marketplace, Points and multichain

The current marketplace reads published listings from a committed dataset; it does not yet provide self-service publishing. Add that capability after direct invites work reliably. Points are a planned activity-reward feature with rules still to define. Multichain follows the Canton workflow and requires separate wallet and settlement integrations.

Current commercial status

VIP pricing, billing and entitlements are pending. Points issuance is not active. The plan assumes no confirmed partner, transaction-fee revenue or network-reward income.
