

People who already have a client

The first audience is independent freelancers and their direct clients. VINSS can provide value to a pair before the marketplace has a large supply of jobs.

Primary user: the independent freelancer

A developer, designer or writer agrees on a defined piece of work with someone they already know through a referral or community. The trigger is a new paid task: they need to state the scope, confirm funding and manage delivery without losing the agreement inside a long chat.

The freelancer is a likely initiator because they can create the room and invite the client. The benefit to test is a clearer path from an accepted offer to a completed payment.

Counterparty: the client buying the work

A founder, creator or small team hires someone for a specific deliverable. The client needs to understand what the offer includes, see the submitted work and know what approval authorizes. A successful experience must make the client comfortable joining a room even when they have never used VINSS before.

User	Reason to use VINSS	Decision to observe
Freelancer	Keep the scope, funding and delivery decision together.	Will they invite a client and use it for another task?
Client	Review work against the accepted offer before settlement.	Can they join, fund and review without technical help?
Repeat user / small team	Reuse common offer terms and retain useful deal records.	Which proposed VIP capability is worth paying for?

Audience status

These are target-user hypotheses. The repository does not record completed customer interviews, paying users or retention results.

A pilot with clear recruitment criteria

Recruit 3-5 client-freelancer pairs for a controlled exercise with test tokens. Observe both people, because one successful wallet connection does not complete a deal.

Suitable for the first cohort	Outside the first cohort
One agreed digital deliverable and an identifiable reviewer.	Open-ended work with unclear approval conditions.
Both participants can use compatible Canton wallets.	Users who require another chain or fiat payment.
Both can attend onboarding and describe failures.	High-value work that already needs arbitration or staged refunds.
A willingness to try a second small task after the first.	Teams requiring multi-party escrow or organization-wide controls.

Questions before the first transaction

Ask where they negotiate, how they confirm funding and what happens when the scope changes. Collect a recent example. Identify who proposes terms, pays and approves delivery.

What to observe during and after the task

Record whether the invite works without manual peer IDs, whether both people describe the accepted terms the same way, and whether they distinguish funded escrow from an accepted offer. After settlement, ask what was confusing, what felt useful and whether they would bring their next counterparty.

Who might pay for VIP

Repeat freelancers and small teams are the proposed subscription customers. Test reusable offer templates, deal exports and additional listings as separate benefits. Ask which recurring task each benefit saves before deciding pricing or implementing billing.

Recruitment channels to test

Direct outreach through freelancer communities and Canton builder contacts. These are proposed channels; no distribution partnership is claimed.
