

VINSS

Private deals between people

Discuss the work privately. Agree on an offer. Settle payment after approval.

The client-work problem

The agreement and payment status live in different places.

Client

Connect the delivered work to the accepted scope. Understand what approving it authorizes.

Freelancer

Confirm which terms were accepted and whether payment is funded. Track what remains before settlement.

Initial use case: one client, one freelancer, one bounded digital deliverable.

The VINSS workflow

A private room connects work terms to the ledger record.

01 Invite

Open a link or QR and connect a Canton wallet.

02 Agree

Discuss work and accept an offer with private terms.

03 Fund escrow

Create the allocation-backed escrow and submit work.

04 Review and settle

Review delivery, approve and produce a settlement receipt.

Groups support encrypted discussion. Offers and escrow remain between two Parties.

Why Canton

Content privacy and workflow authority have separate jobs.

OpenMLS

The browser encrypts messages, detailed offer terms and group membership content.

Canton

Parties sign contracts. Ledger visibility limits disclosure. Daml enforces deal actions and CIP-56 connects settlement.

Authorized ledger viewers can see metadata and deal amounts. Local history is plaintext in the browser.

Evidence already recorded

Evidence	Result	Scope
DevNet escrow, 6 Oct 2026	1 CC settled, receipt and Holding IDs	Earlier real network run
Automated tests, 7 Oct 2026	69 passed across 24 files	Local tests
OpenMLS messaging scenario	10 messages, three-member group	Real WASM, simulated ledger

A fresh live wallet run of the updated messaging release remains to be recorded.

The first users

Start with direct clients, then expand marketplace supply.

Initial pilot

A proposed 3-5 pairs doing design, development or writing work.
Begin with compatible wallets and test tokens.

What to learn

Successful invite joins, complete funded workflows, wallet failures, repeat use and participant interviews.

These are pilot targets and proposed metrics. No paying-user or retention figures are claimed.

Business and distribution

Completed engagements can bring the next client.

Acquisition

Recruit freelance pairs through proposed community channels. Use completed workflows as consented case studies and test counterparty referrals.

Optional VIP

Validate willingness to pay for repeat-project tools. Templates, listings and exports appear in the preview. Pricing and billing remain pending.

Points are planned. No transaction-fee schedule, reward income or confirmed partnership is assumed.

The next Canton pilot

Verify the current release, then validate repeat use.

Immediate proof

Record isolated-wallet invitation, private chat, group messaging and settlement. Retain actual update IDs and visibility results.

Expansion gate

Resolve reliability failures and define dispute/refund handling. Then add self-service publishing and validate VIP. Multichain comes later.
