

GO-TO-MARKET

Win the first complete deal, then earn repeat use.

Position VINSS as a private deal workspace on Canton. Begin with direct invitations between a client and freelancer, where a useful workflow does not depend on a large marketplace.

1. Prove the direct-invite experience

Audience and acquisition. Invite a proposed cohort of 3-5 client-freelancer pairs through freelance communities and Canton builder/community contacts. These are proposed channels, not confirmed partnerships.

Pilot offer. A controlled test-token exercise for one clearly scoped deliverable. Observe wallet onboarding, scope agreement, funding, approval and settlement.

Decision. Resolve the largest repeated failure before expanding the cohort. Collect participant feedback and consent before publishing a case study.

2. Grow through completed engagements

Repeat use. Ask successful pairs to try a second task and invite the next counterparty. Measure repeat completed deals rather than treating wallet connections as adoption.

Marketplace. Add authenticated self-service listing publication after the private workflow works reliably. The current marketplace reads a committed dataset, which has no live listings in this revision.

3. Validate optional membership

Who pays. Test willingness to pay with people handling repeat projects. VIP could provide reusable offer templates, more listings and activity exports, as shown in the existing preview.

Commercial boundary. Subscription pricing, billing and entitlements are not implemented. No transaction-fee schedule or network-reward income is assumed in this plan.

Points. Define an activity reward purpose and earning rules before issuing Points. Rewards and any future token model remain product decisions.

Current scope. Expansion gates: live wallet reliability, useful repeat workflows and an explicit dispute/refund design before broader real-payment use. Multichain follows Canton validation.
