

ICP / AUDIENCE

Direct client work is the first use case.

The proposed first users are freelancers and clients agreeing on one bounded digital deliverable. This audience is a pilot hypothesis, not measured customer traction.

Primary audience: independent freelancers

Who. Developers, designers and writers who already work directly with a client and can define a deliverable, price and review step.

Pain. The scope sits in chat while funding and payment confirmation sit elsewhere. The freelancer must ask which version was accepted and whether the deal is funded.

Value to test. A room that keeps the agreed offer and delivery decisions alongside the funding and settlement record.

The other side: clients and small teams

Who. A client buying a specific piece of work, or a small team coordinating repeat engagements.

Pain. The client must connect the delivered work to the accepted scope and understand what approving it will authorize.

Value to test. Review the private terms and delivery in the room, request revision where needed, and inspect the escrow lifecycle.

Who could pay

Optional VIP. Repeat freelancers and small teams are the proposed subscription audience. The existing preview names reusable offer templates, more listings and deal exports. Pricing, entitlements and billing are pending.

Pilot fit. Start with pairs able to use compatible Canton wallets and a supported token registry. Groups support team discussion while individual escrow agreements remain between two Parties.

Validation questions

Evidence to collect. Can both people join without technical assistance? Does the offer match their understanding of the work? Can they explain the funding and approval steps? Do they reuse the room for another engagement?

Current scope. Pilot proposal: 3-5 client-freelancer pairs, initially with test tokens. No completed customer interviews, paying-user counts or retention figures are recorded yet.
