

METRICS / VALIDATION

Technical evidence, with its scope visible.

VINSS has a recorded Canton DevNet settlement and current automated checks using real OpenMLS WASM. They answer different questions and should be evaluated separately.

DevNet settlement

69

Tests passed

3

Group members tested

Recorded live settlement: 6 October 2026

What happened. The escrow run transferred 1.0000000000 Amulet on DevNet and produced a SettlementReceipt. The record includes agreement, allocation, funding, approval and settlement update IDs, plus the receiver Holding CID.

Where to verify. CANTON_DEVNET_E2E.md, section "Verified DevNet run evidence". This is earlier live settlement evidence, not a fresh wallet test of the updated release.

Automated verification: 7 October 2026

Results. 69 tests passed across 24 test files. The integration scenario completed 10 test messages using bundled OpenMLS WASM and production Canton messaging transport over a simulated ledger.

Coverage. Alice-Bob replies, three-member groups, delayed readers across membership changes, checkpoint/history reload, replay deduplication, QR URL round-trip and ciphertext-only message arguments.

Boundary. Ledger storage, visibility and wallet access are simulated in these checks. They do not prove current live authorization, wallet approvals or unrelated-Party visibility on the actual network.

Next validation

Live software. Repeat invitation, chat, group and escrow with isolated wallets. Record actual update IDs, receiver holdings and visibility results.

User outcomes. Track successful invite joins, completed workflows versus attempts, wallet failures, time to agreement and settlement, repeat use and interview feedback.

Current scope. No user interview results, revenue, conversion rate, retention or external security audit are recorded. Proposed success metrics are not achieved business results.
